Analysis of Expressed Sequence Tags (ESTs) from Fetal and Adult Heart cDNA Libraries Hwang,D.M., Fung,Y.W., Wang,R.X., Laurenssen,C.M., Ng,S.H., Lam,W.Y., Tsui,K.W., Fung,K.P., Waye,M., Lee,C.Y. and Liew,C.C. Analysis of expressed sequence tags from a fetal human heart cDNA Myosin alkali light chain. R57637 Vertebrata; Homo sapiens EST. Unpublished (1995) Eukaryotae; Metazoa; Eumetazoa; Bilateria; Coelomata; Homo sapiens were ligated, followed by digestion with NotI, for direction cloning into predigested lambda gt22. Method is described in J. Mol. Cell. Cardiol. (1994) 26, 1329-1333). mRNA was purified from human fetal hearts (10-12 weeks). cDNA was constructed using a NotI-Oligo dT adaptor-primer. Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

T10486-T10488 are primers used in a RT-PCR reaction to obtain an N-terminal (nuclcotides -111 to 1090) portion of the wild-type p53 gene. An epitope from intron 10 of the human p53 gene is used to
                                                                                                                                                                                                                                                                                  Tumour suppressor; p53; alternative splicing; antibody; cancer; proliferative disorder; psoriasis; prognosis; diagnosis; cell cycle;

The Expressed Sequence Tag was isolated from a human brain cDNA library as part of a large set of ESTs which can be used as markers for human genes transcribed in vivo. They can be used to facilitate tagging of most human genes, for mapping locations of expressed gene

888888 Ş 밁 ç В Mar 25 02:45 Query Match 57.1%; Best Local Similarity 94.4%; Query Match 57.1%; Best Local Similarity 94.4%; Matches Matches for human genes actually transcribed in vivo. Unlike the random genomic DNA sequence tagged sites (STSs), ESTs point directly to expressed genes. The use of ESTs could facilitate the tagging of most expressed human genes within a few years at a fraction of the cost of complete genomic sequencing. Using PCR primers 039419-039580 (sequences designed from the ESTs) sublocalisation of an EST can be achieved with panels of fragments from specific chromosomes or pools of large genomic clones in Human brain Expressed Sequence Tag EST00312. They can be used to facilitate tagging of most human genes, for mapping locations of expressed genes on chromosomes, for individual or forensic identification, for mapping locations of disease-associated genes, for identification of tissue
                                                                                                                                                                                                                                                                           The Expressed Sequence Tag was isolated from a human brain cDNA library as part of a large set of ESTs which can be used as markers

Particular expressed sequence tags from human CDNA - corresponds to transcription prods. of genes, useful for tagging genes, mapping chromosomes and tissue typing Claim 3; Page 171; 199pp; English. This sequence represents an EST (expressed sequence tag) ESTs are markers for human genes actually transcribed in vivo. Unlike the random genomic DNA sequence tagged sites (STSs), ESTs point directly to expressed man genes within a few years at a fraction of the cost of complete genomic sequencing. Using PCR primers Q39419-Q39580 (sequences designed from the ESTs could facilitate the tagging of most expressed man genes within a few years at a fraction of the cost of complete genomic sequencing. Using PCR primers Q39419-Q39580 (sequences designed from the ESTs) sublocalisation of an EST can be achieved with panels of fragments from specific chromosomes or pools of large genomic clones in an analogous manner. This sequence represents EST00337. Sequence 406 BP; 103 A; 109 C; 114 G; 77 T;	Best Local Similarity 94.4%; Pred. Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

#### FEATURES COMMENT REFERENCE ORGANISM JOURNAL AUTHORS source repeat\_region repeat\_region repeat\_region repeat\_region misc\_feature repeat\_region repeat\_region repeat\_region repeat\_region repeat\_region repeat\_region true left end of clone L185F6 is at 31621 in this sequence. This sequence has been finished according to sequence map criteria as follows. An attempt is made to resolve all sequencing problems, constructed using flow-sorted human chromosome 4 from a Hamster-Human hybrid cell line ( $\tt UV20HL21-27$ ) containing human chromosomes 4, 8 and 21. Williamson, H. Homo sapiens L196E3 is contained in a clone contig spanning 2Mb which is described in Baxendale et al, Nature Cenetics 4 (1993) auspices of the U.S. Department of Energy. The library was such as compressions and repeats, but not necessarily within known annotated human repeat sequence elements (e.g. Alu). Where the The true left end of clone L196E3 is at 1 in this sequence. humpub@sanger.ac.uk CB10 1RQ, England. E-mail enquires regarding this sequence: Submitted (31-OCT-1995) Sanger Centre, Hinxton, Cambridgeshire, Eukaryotae; VECTOR: sCosl Genome Center, sequence is ambiguous, there is an annotation using the 'unsure' submissions. shorter because we only sequence overlapping sections once, This sequence is not the entire insert of clone L196E3. IMPORTANT: Direct Submission Vertebrata; 196E3 is from cosmid library LAO4NCO1 constructed at the Human eature key. longer because we arrange for a small overlap between neighbouring 218-230 181- 186. (bases 1 to 31720) /note="Alu 1987..2278 /note="Alu 2575..4365 /note="Alu repeat: matches 1..308 of consensus" 4252..4413 /note="Alu repeat: matches 1553..1846 958..1248 323..612 /cell 3235..3459 /map="4p16.3" 3462..3749 /note="MER42C element fragment" 3093..3146 1262..1546 /note="Alu repeat: matches 1..308 of consensus" /note="L1 element fragment" 229..319 /clone\_lib="LA04NC01" /clone="L196E3" /chromosome="4" /organism="Homo sapiens" Location/Qualifiers 'note="MER42C element fragment" note="match: cDNA D25266" 'note="Alu repeat: matches 308..1 of consensus" mitochondrial eukaryotes; Metazoa; Chordata; Eutheria; Primates; Catarrhini; Hominidae; Homo See also Myers et al, Cytogenet Cell Genet. 66 ( 1994 Los Alamos National Laboratory, NM 87545 under the line="UV20HL21-27" repeat: matches 308..1 of consensus" repeat: matches 1..308 of consensus 308..1 of consensus" It may be

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                         bp fragment contains a BamHI site followed by H6 promoted p53. This was inserted into pNC5LSP5 to generate plasmid pMM148 containing H6 promoted wildtype murine p53 in the ALVAC C5 insertion locus. Recombination
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        of the p53 gene, and the 5' end overlaps fragment II. products were pooled and primed with MM080 and MM085.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           as a template. The 228 bp amplified fragment contains the H6 promoter and the 5'-most bases of the murine p53 gene. Fragment II was produced using primers MM082 and MM083 and plasmid p11-4 as a template. The 129 bp amplified fragment contains the 3' end of the H6 promoter, the 5'-most
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    used in the construction of an ALVAC-based recombinant virus containing the wild-type murine p53 gene. Three PCR fragments were generated. Fragment I was produced using primers MMO80 and MMO81 and plasmid pRW825
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         murine; interleukin-2; IL-2; pRW825; pmut-1; pBS-SK; pMM151; TK vector;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      See also Q51735-45

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   mutant genes were derived from plasmids p53wtXbaISP6/T3, p53-21XbaI are p53-238XbaI respectively. The vaccinia H6 promoter was derived from plasmid pRW825 and precisely linked to the 5'-most region of the p53 gene. The expression cassettes generated by linking the vaccinia H6 promoter and the p53 genes may be cloned in to the poxvirus insertion plasmid, ALVAC, to give vCP207, vCP193 and vCP191 recombinant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            DNA encoding cytokine and/or tumour associated antigen Example 15; Fig 18; 232pp; English.

Rattus norvegicus tumor suppressor (p53) gene, exon 9. L07909 L07781

SOURCE SEGMENT KEYWORDS NID

ORGANISM

Rattus norvegicus tumor suppressor.

Rattus norvegicus (strain Sprague-Dawley) DNA.

Statistics: Mean 7.318; Variance 2.910; scale 2.515

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```

FEATURES

relative to the cDNA [1].

substitutions and to some small deletions or additions in this gene the two sequences differ by only 4%. The differences are due to deverge totally and no homology can be observed; downstream of here
